

Magnetic Sensor ICs

Bipolar Latch Detection High Performance Hall-Effect Sensor IC

AS1691NC

● General Description

Using low power CMOS process, the AS1691NC is designed for low power, high performance latch detection hall-effect application, such as automotive, industrial, electric tools, home appliances, brushless DC motor etc, contactless switch, solid state switch and lid close sensor etc battery operation. The hall IC integrated an on-chip hall voltage generator for magnetic sensing, a comparator that amplifies the hall voltage, a Chopper amplifier, a Schmitt trigger to provide switching hysteresis for noise rejection, and a complementary output.

The total power consumption of AS1691NC is typically less than 2.5mA at 3.6V power supply. AS1691NC is designed to respond to alternating North and South poles. When the magnetic flux density (B) is larger than operate point (B_{OP}), the output will be turned on (low), the output is held until the magnetic flux density (B) is lower than release point (B_{RP}), then turn off (high).

The device is available in SOT23-3L Package and is rated over the -40°C to 125°C . The all packages are RoHS and Green compliant.

● Features

- Input Voltage Range : 2.5V to 5.5V
- Bipolar Latch Operation, easy to use as output
- Chopper stabilization amplifier stage
- Magnetic Sensitivity (typical)
 $B_{OP} = -20\text{Gauss}$, $B_{RP} = +20\text{Gauss}$
- Good RF noise immunity
- Integrated 10Kohms pull-up resistor
- Small Solution Size
- RoHS Compliant
- SOT23-3L Packages
- -40°C to $+125^{\circ}\text{C}$ Temperature Range

● Applications

- Cover switch in Notebook, PC/PAD
- Contact-less switch in consumer products
- Solid State Switch
- Handheld Wireless Handset Awake Switch
- Lid close sensor for battery-powered device
- Magnet proximity sensor for reed switch replacement in low duty cycle applications
- DV, DSC, and White Goods

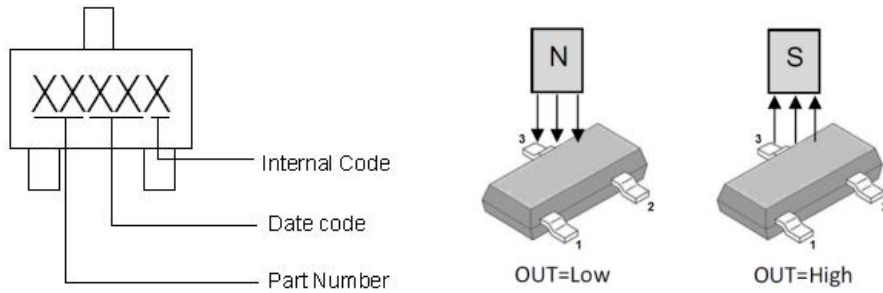

■ Ordering Information

Part Number	B_{OP} (Gauss)	B_{RP} Gauss)	Package Type	Package Qty	Temperature	Eco Plan
AS1691NCSTRN	-20Gauss	+20Gauss	SOT23-3L	7-in reel 3000pcs/reel	$-40 \sim 85^{\circ}\text{C}$	Green
AS1691NCSTRY	-20Gauss	+20Gauss	SOT23-3L	7-in reel 3000pcs/reel	$-40 \sim 125^{\circ}\text{C}$	Green

■ **Marking Information**

SOT23-3L:

Pin Name	Pin No.	I/O	Pin Function
	SOT23-3L		
VDD	1	P	Input Power Supply.
GND	3	P	Ground.
OUT	2	O	Output Pin.

■ **Typical Application Circuit**

Figure 1, Typical Application Circuit of AS1691NC

■ **Block Diagram**

Figure 3, Block Diagram of AS1691NC

Absolute Maximum Ratings¹ ($T_A=25^{\circ}\text{C}$, unless otherwise noted)

Parameter	Symbol	Rating	Unit
V_{DD} Pin to GND	V_{DD}	-0.3 to +6.0	V
Out Pin to GND	V_{OUT}	-0.3 to $V_{DD} + 0.3$	V
Max. Continuous Output Sink Current	$I_{SINKMAX}$	1.0	mA
Magnetic Flux Density	B	Unlimited	Gauss
Package Power Dissipation	P_D	310	mW
Storage Temperature Range	T_S	-55 to +150	$^{\circ}\text{C}$
Operating Junction Temperature Range	T_{OP}	-40 to +150	$^{\circ}\text{C}$
Maximum Soldering Temperature (at leads, 10 sec)	T_{LEAD}	300	$^{\circ}\text{C}$

Recommended Operating Conditions²

Parameter	Symbol	Rating	Unit
V_{DD} Pin to GND	V_{DD}	2.5 to 5.5	V
Continuous Output Current	I_{OUT}	1.0	mA
Operating Temperature Range	T_{OP}	-40 to +125	$^{\circ}\text{C}$

Note: 1: Stresses above those listed in absolute maximum ratings may cause permanent damage to the device. Functional operation at conditions other than the operating conditions specified is not implied. Only one absolute maximum rating should be applied at any one time.

2: The device is not guaranteed to function outside of its operating conditions.

Electrical Characteristics

($T_A = -40$ to $+85^{\circ}\text{C}$ unless otherwise noted. Typical values are at $T_A = +25^{\circ}\text{C}$, $V_{DD} = 3.6\text{V}$)

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
V_{DD}	Input Voltage		2.5	-	5.5	V
$I_{DD(AVG)}$	Supply Current	Average supply current, $T_A=25^{\circ}\text{C}$	-	2.5	-	mA
t_{ON}	Power On Time		-	28	50	μS
V_{SON}	Output Saturation Voltage	$V_{CC} = 5.5\text{V}$, $I_{OUT}=10\text{mA}$	-	0.20	-	V
T_R	Output Rise Time	$R_L=1\text{K}$, $C_L=50\text{pF}$	-	0.45	-	μS
T_F	Output Fall Time	$R_L=1\text{K}$, $C_L=50\text{pF}$	-	0.09	0.2	μS
T_D	Output Delay Time	$B=B_{RP}+50\text{Gs}$ to $B_{OP}-50\text{Gs}$	-	15	25	μS
f_{BW}	Operation Bandwidth		-	50	-	KHz
R	Pull-Up Resistance	Integrated Pull-Up Resistor	-	10	-	K Ω

Magnetic Para.

B_{OPN}	Magnetic Operating Point	SOT23-3L, $T_A=25^{\circ}\text{C}$	-35	-20	-5	Gauss
B_{RPS}	Magnetic Release Point	SOT23-3L, $T_A=25^{\circ}\text{C}$	5	20	35	Gauss
B_{HYS}	Hysteresis Window		-	40	-	Gauss

■ **Hall Sensor Location**

A positive magnetic field is defined as a south pole near the marked side of the package (SOT23-3L package) .

If the device is powered on with a magnetic field strength between B_{RP} and B_{OP} , then the device output is determinate High. For SOT23-3L package, if the field strength is greater than B_{OP} , then the output is pulled low. If the field strength is less than B_{RP} , the output is released.

■ **Typical Output Waveform:**

■ **Function Description**

Chopper-Stabilized Technique

The Hall element can be considered as a resistor array similar to a Wheatstone bridge. A large portion of the offset is a result of the mismatching of these resistors. These devices use a proprietary dynamic offset cancellation technique, with an internal high-frequency clock to reduce the residual offset voltage of the Hall element that is normally caused by device over-molding, temperature dependencies, and thermal stress. The chopper-stabilizing technique cancels the mismatching of the resistor circuit by changing the direction of the current flowing through the Hall plate using CMOS switches and Hall voltage measurement taps, while maintains the Hall voltage signal that is induced by the external magnetic flux. The signal is then captured by a sample-and-hold circuit and further processed using low-offset bipolar circuitry. This technique produces devices that have an extremely stable quiescent Hall output voltage, are immune to thermal stress, and have precise recoverability after temperature cycling. A relatively high sampling frequency is used for faster signal processing capability can be processed.

Magnetic Field Detection Mechanism

The Hall IC cannot detect magnetic fields that run horizontal to the package top layer. Be certain to configure the Hall IC so that the magnetic field is perpendicular to the top layer.

Operation

The output of this device switches low (turns on) when a magnetic field perpendicular to the Hall sensor exceeds the operate point B_{OPS} (or is less than B_{OPN}). After turn-on, the output is capable of sinking up to 1mA and the output voltage is $V_{OUT(ON)}$. When the magnetic field is reduced below the release point B_{RPN} (or increased above B_{RPS}), the device output switches high (turns off). The difference between the magnetic operates and release points are the hysteresis (B_{hys}) of the device. This built-in hysteresis allows clean switching of the output even in the presence of external mechanical vibration and electrical noise.

Applications:

AS1691NC's pole-independent sensing technique allows for operation with either a north or south poles magnet orientation, enhancing the manufacturability of the device. The state-of-the-art technology provides the same output polarity for either pole face.

C1 serves two purposes: minimizing ripples on the input voltage and enhancing immunity from RF transmission noises within close proximity. Recommended values are between 10nF and 100nF. The larger the capacitance, the better the noise immunity is for the AS1691NC.

It is strongly recommended that an external bypass capacitor be connected (in close proximity to the Hall sensor) between the supply and ground of the device to reduce both external noise and noise generated by the chopper-stabilization technique. This is especially true due to the relatively high impedance of battery supplies. The simplest form of magnet that will operate these devices is a bar magnet with either pole near the branded surface of the device.

Thermal Considerations

The maximum IC junction temperature should be restricted to 125°C under normal operating conditions. This restriction limits the power dissipation of the AS1691NC. Calculate the maximum allowable dissipation, $P_{D(max)}$, and keep the actual dissipation less than or equal to $P_{D(max)}$. The maximum-power-dissipation limit is determined using following equation:

$$P_{D(MAX)} = \frac{125^{\circ}\text{C} - T_A}{R_{\theta JA}}$$

Where, T_A is the maximum ambient temperature for the application. $R_{\theta JA}$ is the thermal resistance junction-to-ambient given in Power Dissipation Table.

■ Package Information

SOT23-3L:

Symbol	Dimensions In Millimeters		Dimensions In Inches	
	Min.	Max.	Min.	Max.
A	1.050	1.250	0.041	0.049
A1	0.000	0.100	0.000	0.004
